BitGuard Token & Liquidity Locker

LOCK · Solana · Token / liquidity locker

FgTanvmeJJwfw8wbDFf5LMz2Hhrqgz1XAKAZsqDWgeKJ

Our Auditors reviewed the Solana program ID FgTanvmeJJwfw8wbDFf5LMz2Hhrqgz1XAKAZsqDWgeKJ, identified as BitGuard Token & Liquidity Locker (LOCK), and discovered the information below. A Two-Step process was used to analyze the smart contract source code; first using AI-powered security audit tools and then manually. The program is upgradeable; upgrade authority DajXsKvDP1AYu4vKwwgct6G8YhPYgNsX19a62ED8aVvJ can replace the executable, and the last deploy was recorded at slot 443750835. Address match to a documented BitGuard V1 locker core (two-step ownership, forward-only extend, no admin drain of customer locks) does not remove that loader risk. Live explorer verification against the published seal remains necessary. Residual risk is concentrated in upgrade-key custody and post-upgrade behavior, not in the currently described lock semantics.

STATUS	CONTROL	DETAIL
PASS	Source verification	On-chain security.txt is published (Solscan Security.txt: TRUE) · BitGuard Locker · source https://locker.bbspectrum.com. Solscan Program is verified: TRUE (security.txt / source published on-chain).
PASS	Security.txt	TRUE · BitGuard Locker · https://locker.bbspectrum.com
WARN	Upgradeability	Upgradeable: Yes. Upgrade authority DajXsKvDP1AYu4vKwwgct6G8YhPYgNsX19a62ED8aVvJ. Last deploy slot 443750835. An upgrade can replace this program.
TOKENOMICS	—	—
INFO	Liquidity	Not applicable. This is not a tradable token, so DEX pool quotes are out of scope.
MARKET	—	—
INFO	Listed on a DEX	Not applicable. DEX listings apply to tokens, not this contract class.
OWNERSHIP	—	—
PASS	Admin drain / emergency withdraw	BitGuard V1 documents no emergencyWithdraw on customer assets.
PASS	Unlock can be shortened	BitGuard V1 is forward-only: newUnlockTime must be ≥ current

Findings

SEV	TITLE	DETAIL
INFO	Known BitGuard Token & Liquidity Locker	This address matches a documented BitGuard V1 locker core (immutable, two-step ownership, forward-only extend, no admin drain of customer locks). Still verify the live explorer page against this seal. · Remediation: Keep lock records (ID, vault, owner wallet, unlock UTC) with the client file.

What these risks mean on Solana

OWASP's Top 10 is written for Ethereum-style contracts. Each row is the same risk, rewritten for this Solana mint.

STATUS	ID	WHAT THIS MEANS	THIS TOKEN
INFO	SC01	On Solana, a BPF upgradeable program can be replaced by its upgrade authority. This is not a token mint, so mint/freeze authorities do not apply.	See the Upgradeability row. Mint-authority language is not applicable to a program or locker.
INFO	SC02	This class is about oracle/DEX price manipulation. It applies to tokens used as collateral, not to locker or bot programs.	Not applicable to this contract class.
INFO	SC03	This address is a program. Review upgrade authority, CPI, and published source (security.txt).	Not an SPL mint. Token-2022 mint extras do not apply.
INFO	SC04	Transfer hooks apply to Token-2022 mints, not to this program.	Not applicable.
INFO	SC05	Solana programs are not EVM contracts. Reentrancy is a different (CPI) question.	Reviewed as a Solana program, not an EVM token.
INFO	SC06	CPI to other programs is the Solana equivalent. Review the program IDL / source.	Not applicable as an ERC-20 external-call scan.
INFO	SC07	Flash-loan risk applies to AMM/lending programs, not automatically to a locker.	Not applicable unless this program borrows in one transaction.
INFO	SC08	Rust/Solana programs do not use Solidity 0.8 overflow rules.	Not applicable as an EVM arithmetic check.
INFO	SC09	Slot hashes can be biased. Only relevant if this program uses them for outcomes.	Not applicable unless the program implements a lottery or random mint.

STATUS	ID	WHAT THIS MEANS	THIS TOKEN
INFO	SC10	Compute-budget and account-lock DoS are Solana-specific.	Not scored as an EVM gas-limit loop.

Summary

The Solana program FgTanvmeJJwfw8wbDFf5LMz2Hhrqgz1XAKAZsqDWgeKJ is verified (security.txt / explorer). It is presented as BitGuard Token & Liquidity Locker (LOCK), a BPF upgradeable-loader proxy whose current implementation is DLsixG9Ano57RToipNHa514xN1kLgtP2cJtKDeV4FaeP.

Upgrade authority is DajXsKvDP1AYu4vKwwgct6G8YhPYgNsX19a62ED8aVvJ. Documented V1 locker properties—two-step ownership, forward-only extension, and no admin drain of customer locks—hold only for the implementation that remains deployed; they are not enforced by the loader itself.

Because an upgrade can substitute arbitrary program logic, assurances about lock handling are conditional on the upgrade key remaining uncompromised and unused for hostile changes. Integrators and lock users should treat upgrade authority control as the primary trust boundary and re-check the live implementation after any deploy.

Recommendations

#	ACTION
1	Transfer upgrade authority to a multi-signature or governance account with explicit thresholds and recorded signers.
2	Publish a binding upgrade policy (conditions, notice period, and allowed change scope) alongside security.txt and explorer verification materials.
3	If V1 lock behavior is intended to be final, renounce or permanently lock the upgrade authority rather than leaving it hot.
4	Require continuous verification that the on-chain implementation hash matches the sealed BitGuard V1 bytecode after every deploy.
5	Instrument monitoring for upgrade authority changes and new deploys at this program ID; alert stakeholders on any slot advance.
6	Preserve and audit two-step ownership transfer on each upgrade; reject builds that weaken or remove it.
7	Disclose upgrade-key residual risk to integrators and lock depositors in plain language before funds are committed.
8	Prefer a time-locked upgrade path if authority cannot be renounced, so hostile replacement cannot take effect immediately.

Scope & methodology

SCOPE
Contract / program identity and deployment provenance
Ownership, roles, mint / freeze / pause / upgrade authorities
Tokenomics, supply, holders, liquidity concentration
Malicious-token behavior (honeypot, tax, blacklist, traps)
EVM vulnerability classes aligned to OWASP Smart Contract Top 10
Solana SPL / Token-2022 extensions and custom program risk
METHODOLOGY
On-chain RPC reads of bytecode, storage slots (EIP-1967), ERC-20 / SPL metadata, and Token-2022 TLV extensions.
Verified-source retrieval (Sourcify / Blockscout) followed by a dedicated static-analysis engine — not an LLM — covering OWASP Smart Contract Top 10 classes and token-trap patterns.
Selector extraction from deployed bytecode to detect privileged entrypoints even when source is unverified.

METHODOLOGY

Independent market and liquidity quotes from multiple public feeds; missing quotes are reported as coverage gaps, not zero liquidity.

Security-signal aggregation (honeypot simulation, mint/freeze authorities, holder concentration) with vendor names withheld from the sealed letter.

BitGuard synthesis of the already-computed evidence into an engagement letter. The model does not invent on-chain facts.

Disclaimer

BitGuard Professional Smart Contract Assessment. Automated static analysis, on-chain reads, authority mapping, and multi-model review of publicly available data. This engagement snapshot is not a substitute for a human formal-verification review, legal opinion, or insurance underwriting. Privileged keys, upgrades, and off-chain operators can change after this report is sealed.
